REASON FOR ALLOWANCE

1. Zinke discloses a track support for support of the track of a magnetic levitation railway, consisting of a steel support in the shape of an inverted trapezoid, having sides formed of side wall web plates, an upper base formed by a cover plate, which cover plate has a top side and an underside, and a lower base formed of a base plate the side wall web plates being mounted to the underside of the cover plate and converging at an angle towards and being connected to the base plate, the cover plate projecting laterally over and extending from each side wall to form cantilever arms extending from each side, said cantilever arms each having an upper side and an underside with a stator support web plate projecting approximately perpendicularly from the underside of each cantilever arm, at approximately the middle thereof; and a side guidance rail projecting approximately perpendicularly from the underside of each cantilever arm at the end thereof, a plate being arranged between the end of the stator support web plate and the side wall web plate adjacent to it and between the end of the stator support web plate and the side guidance rail adjacent to it, said plates having an upper side and an underside. Raschbichler et al, Kindmann et al and Wagner disclose various types of track for magnetic levitation train comprising a steel support in the shape of an inverted trapezoid, cover plate projecting laterally over and extending from each side to form cantilever arms extending from each side, said cantilever arms each having an upper side and an underside with a stator support web plate projecting approximately perpendicularly from the underside of each cantilever arm, at approximately the middle thereof; and a side guidance rail projecting approximately perpendicularly from the

underside of each cantilever arm at the end thereof. However, none of the references of record suggests a track support for support of a magnetic levitation railway, wherein a pair of web flanges projecting from the underside of the plates beneath each of the cantilever arms are provided and being parallel to and equidistant from an imaginary extension of the stator support web plates to support a stator pack between each of the pair of web flanges in the manner defined in the instant claims 19-20. Also, none of the references of record suggests a track support wherein a pair of stator support web plates projecting from the underside of each cantilever arm at approximately the middle thereof and diverging away from each other at an acute angle of from 15 to 30 degrees along their projected length are provided in the manner defined in the instant claim 21 and in combination with other limitations of the claim. Therefore, claims 22-27, depending therefrom, are considered to be allowable.
